

Embedded Operating Systems

Trainer: Nilesh Ghule

IPC models

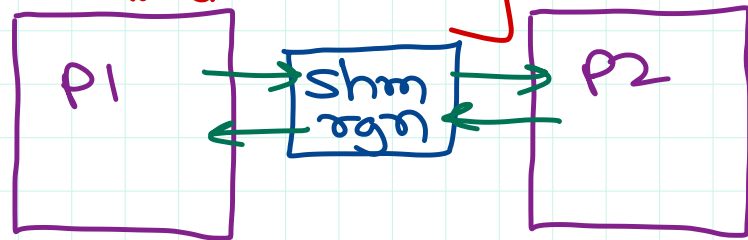

① Message Passing

$P1 \rightarrow OS \rightarrow P2$

linux ipc

- a) signal
- b) msg que
- c) pipe
- d) socket

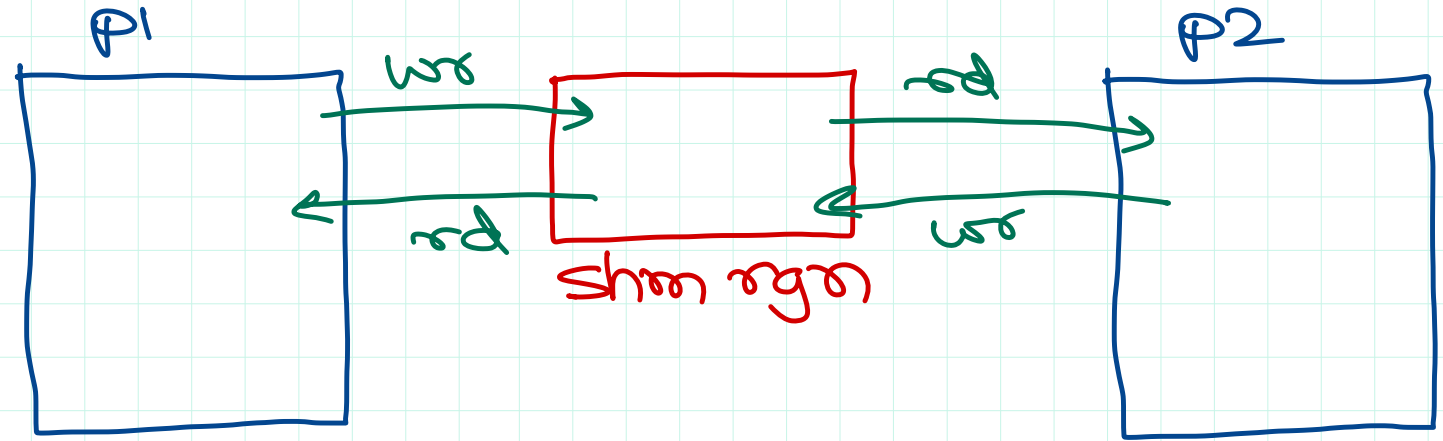

② Shared memory

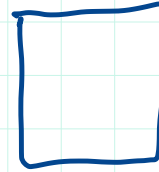

linux ipc

@ shared mem

Shared Memory

PCB-P1

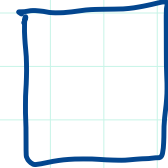

shmtbl

shm obj

Key
perm
owner
size
attach
addr

PCB-P2

Shared Memory Programming Steps

- ① req OS to create shmem segn.
`shmid = shmget(Key, size, IPC_CREAT | 0600);`
- ② get ptr to the shmem.
`ptr = (struct *) shmat(shmid, NULL, 0);`
- ③ write/read in shmem segn.
`ptr → member = ...; // wr`
`x = ptr → member; // rd`
- ④ release ptr of shmem.
`shmdt(ptr);`
- ⑤ req OS to destroy shmem segn
`shmctl(shmid, IPC_RMID, NULL);`

Thank you!
